Advanced Algorithms, Homework 6

Lucas Jones

April 16, 2026

While in this class, you are expected to work on the problems accompanying the textbook (focusing on the odd-numbered exercises), as well as complete any in-class exercises that are not completed during the class period. Below asks you to reflect on your experience working on these problems. The 'hw period' referred to below is from the date the last hw was due until the date this hw is due (tpyically, a two-week span).

1. What problems did you work on during this hw period, and how much time did you spend working on them? If possible, break the reported time down per problem.

   Answer The problems I worked on this hw period includes all of the handout problems aswell as most of the odd numbered examples from the textbook. Problems:

   TB Exercise 1: 20mins

   TB Exercise 3: 20mins

   TB Exercise 5: 30mins

   TB Exercise 7: 20mins

   HO-13: 1hr

   HO-14: 1hr and 30mins

2. Who did you work with on these problems, and describe the collaboration.

   Answer I worked with Henry, and John when working on the problems from the in-class handouts. Our collaboration went well as always, and we were able to find and reasonable answers to every question. I worked by myself when going throught the textbook examples.

3. What external resources did you use while working on these problems? (As a reminder, it is highly encouraged to only use external resources vetted by the instructor. You have all of the tools you need to solve these problems without external resources).

   Answer External resources I used were the lecture/handout notes and assigned textbook chapter on MST's(chapter 7).

4. What went well while working on these problems?

Answer My understanding of graph based algorithms has improved from working through the problems mentioned above.

5. What parts of the homework were most challenging?

Answer The part of this homework period that was the most challenging was the texbook examples where it would ask me to describe and algorithm to accomplish a specific goal. But it was also the most rewarding!

6. How does this material relate to 'real-world' applications?

Answer The material from this homework period relates to real-world applications, because we talk a lot about optimization when looking at these graphing algorithms.
